PENDING CLAIMS AS AMENDED

Please amend the claims as follows:

Claims 1-11 (Canceled)

12. (Currently Amended) A method for fast generation of a cryptographic key, comprising:

generating a first public key for encrypting a first wireless communication; ~~and~~

generating, after termination of the first wireless communication and prior to initiation of a second <u>secure</u> wireless communication <u>with a desired commuication device</u>, a second public key for <u>transmission to the desired communication device</u> ~~use in encrypting the second wireless communication~~, wherein the second public key is independent of the first public key;

<u>storing the second public key in memory prior to initation of the second secure wireless communication with the desired communincation device;</u>

<u>initiating, in response to user input, the second secure wireless communication with the desired communication device; and</u>

<u>transmitting the second public key to the desired communication device if the second public key is available in the memory.</u>

13. (Canceled)

14. (Canceled)

15. (Currently Amended) The method of claim 32, further comprising:

generating a third public key to <u>transmit to the desired communication device</u> ~~encrypt the second wireless communication~~ when it is determined that the second public key has not been stored.

16. (Currently Amended) A wireless communication device for fast generation of a cryptographic key, comprising:

means for generating a first public key for encrypting a first wireless communication; ~~and~~

means for generating, after termination of the first wireless communication and prior to initiation of a second secure wireless communication with a desired communication device, a second public key for transmission to the desired communication device ~~use in encrypting the second wireless communication~~, wherein the second public key is independent of the first public key;

means for storing the second public key in memory prior to initation of the second secure wireless communication with the desired communincation device;

means for initiating, in response to user input, the second secure wireless communication with the desired communication device; and

means for transmitting the second public key to the desired communication device if the second public key is available in the memory.

17. (Canceled)

18. (Canceled)

19. (Currently Amended) The wireless communication device of claim 33, further comprising:

means for generating a third public key to transmit to the desired communication device ~~encrypt the second wireless communication~~ when it is determined that the second public key has not been stored.

20. (Currently Amended) A wireless communication device for fast generation of a cryptographic key, comprising:

a processor for:

generating a first public key to encrypt a first wireless communication; ~~and~~

generating, after termination of the first wireless communication and prior to

initiation of a second <u>secure</u> wireless communication <u>with a desired</u>
<u>communication device</u>, a second public key for <u>transmiision to the desired</u>
<u>communication device;</u> <s>use in encrypting the second wireless communication;</s>
<s>and</s>
<u>storing the second public key in memory prior to initation of the second secure</u>
<u>wireless communication with the desired communincation device;</u>
<u>initiating, in response to user input, the second secure communication with the</u>
<u>desired communication device; and</u>
<u>transmitting the second public key to the desired communication device if the</u>
<u>second public key is available in the memory;</u>

<s>a</s> <u>the</u> memory for storing the second public key,

wherein the second public key is independent of the first public key.

21. (Currently Amended) A processor for fast generation of a cryptographic key, said
processor being configured to:

generate a first public key for encrypting a first wireless communication; <s>and</s>

generate, upon termination of the first wireless communication and prior to initiation of a
second <u>secure</u> wireless communication <u>with a desired communication device</u>, a second public
key for <u>transmission to the desired communication device</u> <s>use in encrypting the second wireless</s>
<s>communication</s>, wherein the second public key is independent of the first public key<u>;</u>

<u>store the second public key in memory prior to initation of the second secure wireless</u>
<u>communication with the desired communincation device;</u>

<u>initiate, in response to user input, the second secure wireless communication with the</u>
<u>desired communication device; and</u>

<u>transmit the second public key to the desired communication device if the second public</u>
<u>key is available in the memory.</u>

22. (Currently Amended) A <u>memory</u> <s>computer program product</s> comprising instructions
for fast generation of a cryptographic key, wherein the instructions upon execution cause a
computer to:

generate a first public key for encrypting a first wireless communication; ~~and~~

generate, after termination of the first wireless communication and prior to initiation of a second <u>secure</u> wireless communication <u>with a desired communication device</u>, a second public key for <u>transmission to the desired communication device</u> ~~use in encrypting the second wireless communication~~, wherein the second public key is independent of the first public key;

<u>store the second public key in memory prior to initation of the second secure wireless communication with the desired communincation device;</u>

<u>initiate, in response to user input, the second secure communication with the desired communication device; and</u>

<u>transmit the second public key to the desired communication device if the second public key is available in the memory.</u>

23. (Currently Amended) The <u>memory</u> ~~computer program product~~ of claim 22, wherein the instructions upon execution further cause a computer to:

determine whether the second public key has been stored prior to establishing the second wireless communication.

24. (Canceled)

25. (Currently Amended) The <u>memory</u> ~~computer program product~~ of claim 23, wherein the instructions upon execution further cause a computer to:

generate a third public key to <u>transmit to the desired communication device</u> ~~encrypt the second wireless communication~~ when it is determined that the second public key has not been stored.

26. (Previously Presented) The processor of claim 21, wherein said processor is further configured to:

determine whether the second public key has been stored prior to establishing the second wireless communication.

27. (Canceled)

28. (Currently Amended) The processor of claim 26, wherein said processor is further configured to:

generate a third public key to <u>transmit to the desired communication device</u> ~~encrypt the second wireless communication~~ when it is determined that the second public key has not been stored.

29. (Previously Presented) The wireless communication device of claim 20, wherein the processor determines whether the second public key has been stored prior to establishing the second wireless communication.

30. (Canceled)

31. (Currently Amended) The wireless communication device of claim 29, wherein the processor generates a third public key to <u>transmit to the desired communication device</u> ~~encrypt the second wireless communication~~ when it is determined that the second public key has not been stored.

32. (Previously Presented) The method of claim 12, further comprising:

determining whether the second public key has been stored prior to establishing the second wireless communication.

33. (Previously Presented) The wireless communication device of claim 16, further comprising:

means for determining whether the second public key has been stored prior to establishing the second wireless communication.

34 - 43. (Canceled)
